

Advisory Regarding Covid-19 Vaccines and Children

December 4, 2021

The Pfizer Covid-19 experimental use vaccine has been approved for 5 to 11-year-old children. Various government agencies are now aggressively marketing this vaccine directly to kids between these ages. A Pfizer TV ad promotes their taking the shot by telling them they will have “super-powers” and be “super-heroes” when they do. Telling the truth is obviously not a priority for Pfizer.¹

We also now know that it is rare for children to spread Covid-19, so the argument that kids are helping others by taking the shot is false.² In addition, we know that children are far more likely to die from the vaccine than from the virus.³

Retired neurosurgeon and former U.S. Secretary of Housing and Urban Development Dr. Ben Carson strongly recommends against children being given the shot.⁴

When asked by host Maria Bartiromo whether he believes young children should receive the COVID-19 vaccine, Carson fired back, "Absolutely not."

"The fact of the matter is, the mortality rate for children from COVID-19 is 0.025, which is very similar to the rate for seasonal flu," he insisted. "And we haven't been for years and years going through all these things for seasonal flu."

He added that the long-term implications of the vaccines for children are currently unknown, which ought to send up red flags for parents.

"Plus, we don't know what the long-term impact of these vaccines is, so this is really sort of a giant experiment," Carson explained. "Do we want to put our children at risk, when we know that the risk of the disease to them is relatively small, but we don't know what the future risks are? Why would we do a thing like that? It makes no sense whatsoever."

We also now know that giving the vaccine to women who are at 20 weeks gestation or less carries an 80% to 90% risk of miscarriage. This means the pharmaceutical companies and government agencies have been misleading us about the safety of the shot for pregnant women.⁵

Data is being dismissed showing kids are generally not at high risk of getting sick from Covid-19.⁶ Why would Pfizer be promoting a vaccine that it knows is harmful to children and pregnant women? Pfizer announced several months ago that it expected to make 24 billion dollars on its Covid-19 shot in 2021. Does this fact explain Pfizer's motivation? Do you really trust Pfizer or the FDA to give you accurate information on the shot?⁷

Based on what we see happening now, we are obligated to warn others to keep children and pregnant women away from the Covid-19 vaccine.
